

DORGCON Hackathon: Building a Shared Client Relationship View

A business-focused hackathon to create a shared, trusted view of client relationships across the firm, enabling smarter growth, risk awareness, and decision-making.

Quick Brief (For Teams)

How to use this doc:

- **Read now:** Use the **Quick Brief** to align on what to build, what to demo, and where the data lives.
- **Reference later:** Use the **Master Brief (Full Details)** for deeper context, definitions, scope, and demo inspiration.
- **Keep handy:** Come back to this doc during the hackathon to confirm deliverables, evaluation criteria, and submission details.

Quick Brief Summary

- **Goal:** Demonstrate a shared, trusted view of client relationships so leaders can make faster decisions on growth, coordination, and risk.
- **When:** May 12–15, 2026.
- **Who it's for:** Relationship and growth leaders (e.g., Jordan Patel).
- **Build:** A leader-friendly shared client relationship view for priority clients/entities, including relationship signals (parent/child, ownership, shared leadership, geographic overlap, industry alignment) and indicators for health/risk/opportunity.
- **Deliver:** Demo story + understandable output (dashboard/notebook/prototype/report) + data/model explanation + “if we scaled this” notes.
- **Use:** Databricks shared catalog (teams and access are set up). Output can be any demo-able format as long as it tells a clear leader story.
- **Judging:** Business value, trust/clarity, insight, and reusability (path to scale).
- **Submit:** Due by 3pm Thu, May 14; questions to Rebecca Michael or Bryce Plagman.

What teams will build

- A **shared client relationship view** for a set of priority clients/entities using the Databricks dataset.
- A way to identify and/or represent relationships such as **parent/child, ownership, shared leadership, geographic overlap, and industry alignment** (as supported by the data).
- Leader-friendly indicators that help interpret **client health, risk, and opportunity**.

Required deliverables (demo-ready)

- **Demo story:** show the problem, what you built, and how a leader would use it to make a decision.
- **Shared view output:** dashboard, notebook, prototype, or report that a non-technical leader can understand.
- **Data/model explanation:** what sources you used, key joins/assumptions, and where the data is weak or ambiguous.
- **“If we scaled this” notes:** what governance/ownership/definitions would be needed to operationalize.

Scope

In scope	Out of scope
• Demonstrate a shared client relationship view. • Combine key client info from multiple sources (as available in Databricks). • Show how leaders assess health, risk, and opportunity.	• Full production CRM/client platform. • Complete coverage for all clients. • Long-term operational ownership model (define what it would be, don't implement it).

Data & tools

- **Data source:** Databricks shared catalog (dataset/file name: [sbx-eus2-data-analytics-main-databricks-ws-001-eastus2](#)).
- **Access:** Required team structures and shared catalog have been set up so you can focus on building.
- **Output format:** Anything demo-able (notebook, dashboard, prototype, slide + screenshots), as long as it tells a clear leader story.

How you'll be evaluated (aligned to "What Success Looks Like")

- **Business value:** Does it enable better, faster client decisions (growth, coordination, risk)?
- **Trust & clarity:** Are definitions/assumptions clear, and can a leader trust what they're seeing?
- **Insight:** Did you surface an opportunity, risk, or relationship connection that isn't obvious today?
- **Reusability:** Is there a believable path to scale beyond this demo?

Suggested demo flow

1. **Start with the leader question:** "What do we know about this client relationship network, and what should we do next?"
2. **Show the shared view:** entities, relationships, and key indicators.
3. **Call out one insight:** opportunity, risk, or coordination gap.
4. **Explain how you built it:** sources, joins, assumptions, and data quality issues.
5. **Close with next steps:** what would be needed to scale (definitions, ownership, validation, cadence).

Need more details? The sections below provide fuller context, scope, and demo inspiration.

Submissions:

Submissions due by 3pm Thursday, May 14.

[Submit your teams solutions here](#)

- Thursday night: committee reviews submissions and selects the top 4.
- Thursday dinner: top 4 teams announced.
- Friday, May 15: top 4 teams demo their product for judging.
- Prizes will be awarded to the top three teams.

Please direct any questions to Dee.Schmidtvoigt@claconnect.com or Bryce.Plagman@claconnect.com.

Master Brief (Full Details)

Master Brief Summary

- **Context:** In professional services, growth and risk management require understanding the full network of client entities and relationships across service lines, industries, and geographies.
- **User:** Jordan Patel (relationship/growth leader) needs an end-to-end view of engagement, opportunity, and risk across strategic accounts.

- **Current pain:** Relationship context is fragmented across systems; parent/child and ownership aren't consistently identified; client-to-client connections are inconsistently understood; decisions rely on manual stitching.
- **Core problem:** CLA lacks a standardized, scalable way to identify, model, validate, and use client-to-client relationships across systems leading to missed opportunities, increased compliance/COI risk, inconsistent reporting, and reactive decision-making.
- **Why now:** Clients expect coordinated experiences; growth depends on cross-service visibility; leaders need earlier indicators of health; existing data investments need to produce a unified picture.
- **Success looks like:** A leader-usable shared relationship view for priority clients that supports faster, proactive decisions and shows a credible path to scale (not just technical output).
- **How data/tech helps:** Connect engagement/financial/relationship data, apply consistent definitions/validation, and surface insights in a leader-friendly way using a reusable approach.
- **Hackathon scope:** Prove value and direction with Databricks data (shared catalog and team setup provided); not a full CRM, not full client coverage, and not a long-term ownership implementation.
- **Scale metrics (examples):** Service coverage, share of wallet, competitor displacement, cross-sell trend, net revenue retention, client experience; plus leading indicators like validated relationship coverage, introductions-to-opportunities, and adoption/usage.

Industry & Business Context

In professional services, growth and risk management depend on understanding the full network of client entities and relationships and acting early on what we learn across the firm.

Organizational Context

CLA is a large professional services organization built on long-term client relationships. Clients are often served by multiple teams across service lines, industries, and geographies. Each team has important client information (needs, activity, risk, and opportunity), but it is often spread across systems and teams.

As expectations rise for proactive, coordinated client management, leaders need one shared view of the full client relationship, not just individual engagements or point-in-time financial snapshots.

Target User Persona

Jordan Patel, Vice President, Client Growth and Relationships

Jordan is responsible for retention, growth, and relationship health across a portfolio of strategic clients. Success depends on a clear, end-to-end view of how clients engage with the firm, where opportunity is emerging, and where risk is rising.

For the hackathon, we will ground this persona in a real dataset available in Databricks (data file: [\[sbx-eus2-data-analytics-main-databricks-ws-001 eastus2\]](#)). A shared catalog has been created for teams, and the required team structures have been set up so teams can focus on building and demonstrating one shared view of the client relationship.

Business Reality & Daily Challenges

Jordan needs the full reality of each client relationship, not just individual engagements. Today, that view is incomplete and often requires manual stitching across people, systems, and spreadsheets.

Common challenges include:

- Parent/child, and ownership relationships are not consistently identified or validated.
- Client-to-client connections (shared leadership, ownership, geographic overlap, industry alignment) are understood inconsistently across teams.

- Relationship context is fragmented across CRM, engagement, financial, and operational systems.
- Cross-sell and market expansion opportunities can be missed due to incomplete relationship insight.
- Conflict-of-interest risks are identified reactively instead of proactively.
- Reporting across industries, regions, and legal entities is difficult to reconcile.

Multiple Data Organization teams address pieces of this problem, but without a shared framework the insight stays partial, manual, and slow. The result is delayed decisions, missed opportunities, and increased risk.

The Core Business Problem

What is fundamentally broken or inefficient?

CLA does not yet have a standardized, scalable way to identify, model, validate, and use client-to-client relationships (parent/child, ownership, shared leadership, geographic overlap, industry alignment) across systems.

Without a unified client relationship framework, the firm faces:

- Missed revenue and market expansion opportunities.
- Increased compliance risk and conflict-of-interest risk.
- Inconsistent reporting and analysis across the organization.
- Manual, reactive decision-making that does not scale.

This limits proactive relationship management, coordination across teams, and timely decision-making.

Why This Matters Now

- Clients expect a coordinated, firm-wide experience.
- Growth increasingly depends on cross-service visibility and insight.
- Leaders need earlier, forward-looking indicators of client health.
- Existing data investments are not yet delivering a unified client picture.

The DORGCON Hackathon provides a focused opportunity to demonstrate what a shared client relationship view could look like.

What Success Looks Like

At the end of the hackathon, success means:

- A shared client relationship view is demonstrated for a set of priority clients/entities.
- Leaders can make faster, more coordinated decisions for priority clients because teams are working from one shared view.
- Teams can see where CLA is not fully serving the client and prioritize actions to expand service coverage and improve client experience.
- Key client information is brought together in a coherent, trusted way.
- Leaders can quickly interpret clients' health, risk, and opportunity.
- Conversations shift from reactive updates to proactive planning.
- The approach is reusable and shows a clear path to scale.

Success is defined by better client decisions, not just technical output.

How Data & Technology Enable the Outcome

Data and technology enable success by connecting, standardizing, and surfacing key client information across the firm.

This includes:

- Bring engagement, financial, and relationship information into one place.
- Use consistent definitions and validation so teams can trust what they see.
- Present insights in a leader-friendly way that supports action.

The focus is a reusable approach to build and maintain a shared client relationship view, not a one-off report.

Conceptual Client Relationship View Flow

Stage	Description	Business Value
Input	Engagement, financial, and client data	Captures the full client picture
Process	Standardize and enrich the data	Improves consistency and trust
Output	Shared client views and indicators	Enables proactive decisions

Hackathon Scope & Constraints

For the quick visual, use the **Quick Brief → Scope** table. This section restates scope at a high level for context.

In scope

- Demonstrate a shared client relationship view.
- Bring key client information from multiple sources into one view (as available).
- Show how leaders assess client health, risk, and opportunity.

Out of scope

- A full production CRM or client platform.
- Complete data coverage for all clients.
- Implementing long-term operational ownership models.

The goal is to prove value and direction, not to deliver a finished system.

Why This Is a Strong Hackathon Use Case

- Client relationships are central to the firm's success.
- The problem is widely felt across leadership and delivery teams.
- The scope is achievable within a hackathon setting.
- The outcome can inform future client relationship view and reporting efforts.
- It supports a seamless, "one-stop shop" client experience by making the full relationship context and needs visible in one place.
- It helps partners identify warm introductions and adjacent opportunities, enabling new business generation through relationship networks.

Candidate Metrics to Scale After the Hackathon

Working definition: “Fully fledged partner” means CLA has essentially all the client’s business for the services we provide.

Outcomes

- Service coverage: % of CLA service areas the client buys from CLA.
- Share of wallet: CLA revenue as a % of the client’s total spend in CLA service areas (when available).
- Work moved from competitors: # of services moved to CLA (and estimated \$ impact), per account/year.
- Cross-sell: # of CLA service lines the client uses, and the trend over time.
- Retention and expansion: net revenue retention for strategic accounts across CLA service areas.
- Client experience: satisfaction/NPS (or equivalent) for strategic accounts, focused on coordination and responsiveness.

Leading indicators

- Relationship coverage: % of priority clients with an assigned relationship owner and validated parent structure.
- Introductions that turn into opportunities: # of partner introductions that become qualified opportunities (and \$ pipeline created).
- Adoption: % of partners and relationship leaders who use the shared client view regularly and take key actions (e.g., review, update, log introductions).

This positions the DORGCON Hackathon as a catalyst for stronger, more informed client relationships.

Summary

In summary, this hackathon will show how CLA can bring key client information into one shared view that leaders can trust and use. It will deliver proof of value for priority clients and clarify the data, governance, and next steps needed to be scaled.

Demo Ideas (Inspiration Only)

These are examples to spark ideas. Teams are encouraged to explore the Databricks dataset and choose a demo approach that best reflects what they discover.

- **Example: Shared view** — present a shared view of one or more clients/entities based on what you can assemble from the data.
- **Example: Key insight** — highlight an insight or pattern you discovered (opportunity, risk, relationship connection, or coordination need).
- **Example: Recommended next steps** — propose next actions, follow-up questions, and what you would add to strengthen the shared view over time.

Teams should showcase their work as an end-to-end story that demonstrates how a cross-functional DORG team moves from data intake to a usable outcome.

- **Positive route (happy path):** how the work flows end-to-end when data and handoffs go as expected.
- **Negative route (exceptions):** how the team handles common exceptions (e.g., unclear definitions, data conflicts, missing ownership) and what decisions/escalations are needed to move forward.

End-to-end story components to include in your demo:

- **Intake & understanding:** what the data is, what it represents, and how you approached it.
- **Engineering:** key joins, standardization, and the core data model needed for the shared view.
- **Governance:** how definitions, ownership, and appropriate use would be handled.
- **Product thinking:** what the “shared view” should look like for a leader like Jordan and why.
- **Operations & adoption:** how it would be maintained and used in day-to-day work.
